

DATA STRUCTURES USING C++

LABORATORY MANUAL

**B.TECH
(II YEAR – I SEM)
(2018-19)**

**DEPARTMENT OF
COMPUTER SCIENCE AND ENGINEERING**

**MALLA REDDY COLLEGE OF ENGINEERING &
TECHNOLOGY**

(Autonomous Institution – UGC, Govt. of India)

Recognized under 2(f) and 12 (B) of UGC ACT 1956

(Affiliated to JNTUH, Hyderabad, Approved by AICTE - Accredited by NBA & NAAC – ‘A’ Grade - ISO 9001:2015 Certified)
Maisammaguda, Dhulapally (Post Via. Hakimpet), Secunderabad – 500100, Telangana State, India

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Vision

- To acknowledge quality education and instill high patterns of discipline making the students technologically superior and ethically strong which involves the improvement in the quality of life in human race.

Mission

- To achieve and impart holistic technical education using the best of infrastructure, outstanding technical and teaching expertise to establish the students into competent and confident engineers.
- Evolving the center of excellence through creative and innovative teaching learning practices for promoting academic achievement to produce internationally accepted competitive and world class professionals.

PROGRAMME EDUCATIONAL OBJECTIVES (PEOs)

PEO1 – ANALYTICAL SKILLS

1. To facilitate the graduates with the ability to visualize, gather information, articulate, analyze, solve complex problems, and make decisions. These are essential to address the challenges of complex and computation intensive problems increasing their productivity.

PEO2 – TECHNICAL SKILLS

2. To facilitate the graduates with the technical skills that prepare them for immediate employment and pursue certification providing a deeper understanding of the technology in advanced areas of computer science and related fields, thus encouraging to pursue higher education and research based on their interest.

PEO3 – SOFT SKILLS

3. To facilitate the graduates with the soft skills that include fulfilling the mission, setting goals, showing self-confidence by communicating effectively, having a positive attitude, get involved in team-work, being a leader, managing their career and their life.

PEO4 – PROFESSIONAL ETHICS

To facilitate the graduates with the knowledge of professional and ethical responsibilities by paying attention to grooming, being conservative with style, following dress codes, safety codes, and adapting themselves to technological advancements.

PROGRAM SPECIFIC OUTCOMES (PSOs)

After the completion of the course, B. Tech Computer Science and Engineering, the graduates will have the following Program Specific Outcomes:

1. **Fundamentals and critical knowledge of the Computer System:-** Able to Understand the working principles of the computer System and its components , Apply the knowledge to build, asses, and analyze the software and hardware aspects of it .

2. **The comprehensive and Applicative knowledge of Software Development:** Comprehensive skills of Programming Languages, Software process models, methodologies, and able to plan, develop, test, analyze, and manage the software and hardware intensive systems in heterogeneous platforms individually or working in teams.

3. **Applications of Computing Domain & Research:** Able to use the professional, managerial, interdisciplinary skill set, and domain specific tools in development processes, identify the research gaps, and provide innovative solutions to them.

PROGRAM OUTCOMES (POs)

Engineering Graduates will be able to:

1. **Engineering knowledge:** Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.
2. **Problem analysis:** Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.
3. **Design / development of solutions:** Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
4. **Conduct investigations of complex problems:** Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.
5. **Modern tool usage:** Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.
6. **The engineer and society:** Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.
7. **Environment and sustainability:** Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
8. **Ethics:** Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.
9. **Individual and team work:** Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
10. **Communication:** Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
11. **Project management and finance:** Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multi disciplinary environments.
12. **Life- long learning:** Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

MALLA REDDY COLLEGE OF ENGINEERING & TECHNOLOGY

Maisammaguda, Dhulapally Post, Via Hakimpet, Secunderabad – 500100

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

GENERAL LABORATORY INSTRUCTIONS

1. Students are advised to come to the laboratory at least 5 minutes before (to the starting time), those who come after 5 minutes will not be allowed into the lab.
2. Plan your task properly much before to the commencement, come prepared to the lab with the synopsis / program / experiment details.
3. Student should enter into the laboratory with:
 - a. Laboratory observation notes with all the details (Problem statement, Aim, Algorithm, Procedure, Program, Expected Output, etc.,) filled in for the lab session.
 - b. Laboratory Record updated up to the last session experiments and other utensils (if any) needed in the lab.
 - c. Proper Dress code and Identity card.
4. Sign in the laboratory login register, write the TIME-IN, and occupy the computer system allotted to you by the faculty.
5. Execute your task in the laboratory, and record the results / output in the lab observation note book, and get certified by the concerned faculty.
6. All the students should be polite and cooperative with the laboratory staff, must maintain the discipline and decency in the laboratory.
7. Computer labs are established with sophisticated and high end branded systems, which should be utilized properly.
8. Students / Faculty must keep their mobile phones in SWITCHED OFF mode during the lab sessions. Misuse of the equipment, misbehaviors with the staff and systems etc., will attract severe punishment.
9. Students must take the permission of the faculty in case of any urgency to go out ; if anybody found loitering outside the lab / class without permission during working hours will be treated seriously and punished appropriately.
10. Students should LOG OFF/ SHUT DOWN the computer system before he/she leaves the lab after completing the task (experiment) in all aspects. He/she must ensure the system / seat is kept properly.

Head of the Department

Principal

OBJECTIVES AND OUTCOMES

Objectives:

- To write and execute programs in C++ to solve problems using data structures such as arrays, linked lists, stacks, queues, trees, graphs, hash tables and search trees.
- To write and execute write programs in C++ to implement various sorting and searching methods.

Outcomes:

- Ability to identify the appropriate data structure for given problem.
- Graduate able to design and analyze the time and space complexity of algorithm or program.
- Ability to effectively use compilers includes library functions, debuggers and trouble shooting.

Vision:

To acknowledge quality education and instill high patterns of discipline making the students technologically superior and ethically strong which involves the improvement in the quality of life in human race.

Mission:

To achieve and impart holistic technical education using the best of infrastructure, outstanding technical and teaching expertise to establish the students into competent and confident engineers.

Evolving the center of excellence through creative and innovative teaching learning practices for promoting academic achievement to produce internationally accepted competitive and world class professionals.

RECOMMENDED SYSTEM / SOFTWARE REQUIREMENTS:

1. Intel based desktop PC of 166MHz or faster processor with at least 64 MB RAM and 100 MB free disk space.
2. turbo C++ compiler or GCC compilers

USEFUL TEXT BOOKS / REFERECEES :

1. Data structures, Algorithms and Applications in C++, S.Sahni, University Press (India) Pvt.Ltd, 2nd edition, Universities Press Orient Longman Pvt. Ltd.
2. Data structures and Algorithms in C++, Michael T.Goodrich, R.Tamassia and .Mount, Wiley student edition, John Wiley and Sons.
3. Data structures using C and C++, Langsam, Augenstein and Tanenbaum, PHI.

DATA STRUCTURES USING C++ Lab Manual

List of programs

S.No	Name of the program	Page no	Date	Faculty sign
1.	Write a C++ programs to implement recursive and non recursive i) Linear search ii) Binary search	1		
2.	Write a C++ programs to implement i) Bubble sort ii) Selection sort iii) quick sort iv) insertion sort	6		
3.	Write a C++ programs to implement the following using an array. a) Stack ADT b) Queue ADT	12		
4.	Write a C++ programs to implement list ADT to perform following operations a) Insert an element into a list. b) Delete an element from list c) Search for a key element in list d)count number of nodes in list	18		
5.	Write C++ programs to implement the following using a singly linked list.Stack ADT b) Queue ADT	26		
6	Write C++ programs to implement the deque (double ended queue) ADT using a doubly linked list and an array.	32		
7	Write a C++ program to perform the following operations: a) Insert an element into a binary search tree. b) Delete an element from a binary search tree. c) Search for a key element in a binary search tree.	38		
8	Write C++ programs for implementing the following sorting methods:Merge sort b) Heap sort	43		
9	.Write C++ programs that use recursive functions to traverse the given binary tree in a) Preorder b) inorder and c) postorder.	48		
10	Write a C++ program to perform the following operations a) Insertion into a B-tree b) Deletion from a B-tree	54		
11	Write a C++ program to perform the following operations a)Insertion into an AVL-tree b) Deletion from an AVL-tree	62		
12	Write a C++ program to implement all the functions of a dictionary (ADT)	70		

Week 1: write a C++ programs to implement recursive and non recursive i) Linear search ii) Binary

Aim: To implement Linear search and binary search recursively and non recursively

Description:

i) LINEAR SEARCH (SEQUENTIAL SEARCH): Search begins by comparing the first element of the list with the target element. If it matches, the search ends. Otherwise, move to next element and compare. In this way, the target element is compared with all the elements until a match occurs. If the match do not occur and there are no more elements to be compared, conclude that target element is absent in the list.

For example consider the following list of elements.

5 9 7 8 11 2 6 4

To search for element 11(i.e Key element = 11). first compare the target element with first element in list i.e. 5. Since both are not matching we move on the next elements in the list and compare. Finally found the match after 5 comparisons.

Algorithm for Linear search

Linear_Search (A[], N, val , pos)

Step 1 : Set pos = -1 and k = 0

Step 2 : Repeat while k < N

 Begin

 Step 3 : if A[k] = val

 Set pos = k

 print pos

 Goto step 5

 End while

Step 4 : print "Value is not present"

Step 5 : Exit

Source code: Non recursive C++ program for Linear search

```
#include<iostream>
using namespace std;
int Lsearch(int list[ ],int n,int key);
int main()
{
int n,i,key,list[25],pos;
cout<<"enter no of elements\n";
cin>>n;
cout<<"enter "<<n<<" elements ";
for(i=0;i<n;i++)
    cin>>list[i];
cout<<"enter key to search";
cin>>key;
pos= Lsearch (list,n,key);
if(pos== -1)
    cout<<"\nelement not found";
else
    cout<<"\n element found at index "<<pos;
}
```

```
/*function for linear search*/
int Lsearch(int list[],int n,int key)
{
int i,pos=-1;
for(i=0;i<n;i++)
if(key==list[i])
{
    pos=i;
    break;
}
return pos;
}
```

Results

Source code: Recursive C++ program for Linear search

```
#include<iostream>
using namespace std;
int Rec_Lsearch(int list[ ],int n,int key);
int main()
{
int n,i,key,list[25],pos;
    cout<<"enter no of elements\n";
    cin>>n;
    cout<<"enter "<<n<<" elements ";
    for(i=0;i<n;i++)
        cin>>list[i];
    cout<<"enter key to search";
    cin>>key;
    pos=Rec_Lsearch(list,n,key);
    if(pos== -1)
        cout<<"\n element not found";
    else
        cout<<"\n element found at index "<<pos;
}
/*recursive function for linear search*/
int Rec_Lsearch(int list[],int n,int key)
{
if(n<=0)
    return -1;
```

```

if(list[n]==key)
    return n;
else
    return Rec_Lsearch(list,n-1,key);
}

```

Results

ii) Binary Searching: Before searching, the list of items should be sorted in ascending order. First compare the key value with the item in the mid position of the array. If there is a match, we can return immediately the position. if the value is less than the element in middle location of the array, the required value is lie in the lower half of the array.if the value is greater than the element in middle location of the array, the required value is lie in the upper half of the array. We repeat the above procedure on the lower half or upper half of the array.

Algorithm:

```

Binary_Search (A [ ], U_bound, VAL)
Step 1 : set BEG = 0 , END = U_bound , POS = -1
Step 2 : Repeat while (BEG <= END )
Step 3 :     set MID = ( BEG + END ) / 2
Step 4 :     if A [ MID ] == VAL then
                POS = MID
                print VAL " is available at ", POS
                GoTo Step 6
            End if
            if A [ MID ] > VAL then
                set END = MID - 1
            Else
                set BEG = MID + 1
            End if
        End while
Step 5 : if POS = -1 then
            print VAL " is not present "
        End if
Step 6 : EXIT

```

Source code: Non recursive C++ program for binary search

```

#include<iostream>
using namespace std;
int binary_search(int list[],int key,int low,int high);
int main()
{
int n,i,key,list[25],pos;
    cout<<"enter no of elements\n" ;
    cin>>n;

```

```

cout<<"enter "<<n<<" elements in ascending order ";
for(i=0;i<n;i++)
cin>>list[i];
cout<<"enter key to search" ;
cin>>key;
pos=binary_search(list,key,0,n-1);
if(pos==-1)
    cout<<"element not found" ;
else
    cout<<"element found at index "<<pos;
}
/* function for binary search*/
int binary_search(int list[],int key,int low,int high)
{
int mid, pos=-1;
while(low<=high)
{
    mid=(low+high)/2;
    if(key==list[mid])
    {
        pos=mid;
        break;
    }
    else if(key<list[mid])
        high=mid-1;
    else
        low=mid+1;
}
return pos;
}

```

Results

Source code: Recursive C++ program for binary search

```

#include<iostream>
using namespace std;
int rbinary_search(int list[],int key,int low,int high);
int main()
{
int n,i,key,list[25],pos;
cout<<"enter no of elements\n" ;
cin>>n;
cout<<"enter "<<n<<" elements in ascending order ";
for(i=0;i<n;i++)

```

```

cin>>list[i];
cout<<"enter key to search" ;
cin>>key;
pos=rbinary_search(list,key,0,n-1);
if(pos==-1)
    cout<<"element not found" ;
else
    cout<<"element found at index "<<pos;
}
/*recursive function for binary search*/
int rbinary_search(int list[ ],int key,int low,int high)
{
int mid,pos=-1;
if(low<=high)
{
    mid=(low+high)/2;
    if(key==list[mid])
    {
        pos=mid;
        return pos;
    }
    else if(key<list[mid])
        return rbinary_search(list,key,low,mid-1);
    else
        return rbinary_search(list,key,mid+1,high);
}
return pos;
}

```

Results

Assignment :-

Task	date	sign	Remarks
1. Write a program to find an element in the list of elements using linear and binary search non recursively ,provide a provision to select between linear and binary searching.			
2. Write a program to find an element in the list of elements using linear and binary search recursively, provide a provision to select between linear and binary searching.			
3. write a program to implement searching using linked list			
4. Submit an analysis report of merits and demerits of linear and binary searching.			

Week 2: write a C++ programs to implement i) Bubble sort ii) Selection sort iii) quick sort iv) insertion

Aim: To implement i) Bubble sort ii) Selection sort iii) Quick sort iv) Insertion sort

Description:

i)Bubble sort

The bubble sort is an example of exchange sort. In this method, repetitive comparison is performed among elements and essential swapping of elements is done. Bubble sort is commonly used in sorting algorithms. It is easy to understand but time consuming i.e. takes more number of comparisons to sort a list . In this type, two successive elements are compared and swapping is done. Thus, step-by-step entire array elements are checked. It is different from the selection sort. Instead of searching the minimum element and then applying swapping, two records are swapped instantly upon noticing that they are not in order.

ALGORITHM:

Bubble_Sort (A [] , N)

```

Step 1: Start
Step 2: Take an array of n elements
Step 3: for i=0,.....n-2
Step 4: for j=i+1,.....n-1
Step 5: if arr[j]>arr[j+1] then
        Interchange arr[j] and arr[j+1]
        End of if
Step 6: Print the sorted array arr
Step 7:Stop

```

Source code: Write a program to sort a list of numbers using bubble sort

```

#include<iostream>
using namespace std;
void bubble_sort(int list[30],int n);
int main()
{
int n,i;
int list[30];
    cout<<"enter no of elements\n";
    cin>>n;
    cout<<"enter "<<n<<" numbers ";
    for(i=0;i<n;i++)
        cin>>list[i];
    bubble_sort (list,n);
    cout<<" after sorting\n";
    for(i=0;i<n;i++)
        cout<<list[i]<<endl;
return 0;
}
void bubble_sort (int list[30],int n)
{
int temp ;
int i,j;
    for(i=0;i<n;i++)

```

```

for(j=0;j<n-1;j++)
if(list[j]>list[j+1])
{
    temp=list[j];
    list[j]=list[j+1];
    list[j+1]=temp;
}
}

```

Results

ii) Selection sort (Select the smallest and Exchange):

The first item is compared with the remaining n-1 items, and whichever of all is lowest, is put in the first position. Then the second item from the list is taken and compared with the remaining (n-2) items, if an item with a value less than that of the second item is found on the (n-2) items, it is swapped (Interchanged) with the second item of the list and so on.

Algorithm:

Selection_Sort (A [] , N)

Step 1 :start

Step 2: Repeat For K = 0 to N – 2

 Begin

Step 3 : Set POS = K

Step 4 : Repeat for J = K + 1 to N – 1

 Begin

 If A[J] < A [POS]

 Set POS = J

 End For

Step 5 : Swap A [K] with A [POS]

 End For

Step 6 : stop

Source code: Program to implement selection sort

```

#include<iostream>
using namespace std;
void selection_sort (int list[],int n);
int main()
{
int n,i;
int list[30];

```

```

cout<<"enter no of elements\n";
cin>>n;
cout<<"enter "<<n<<" numbers ";
for(i=0;i<n;i++)
cin>>list[i];
selection_sort (list,n);
cout<<" after sorting\n";
for(i=0;i<n;i++)
cout<<list[i]<<endl;
return 0;
}
void selection_sort (int list[],int n)
{
int min,temp,i,j;
for(i=0;i<n;i++)
{
    min=i;
    for(j=i+1;j<n;j++)
    {
        if(list[j]<list[min])
        min=j;
    }
    temp=list[i];
    list[i]=list[min];
    list[min]=temp;
}
}

```

Results

iii) Quick sort: It is a divide and conquer algorithm. Quick sort first divides a large array into two smaller sub-arrays: the low elements and the high elements. Quick sort can then recursively sort the sub-arrays.

ALGORITHM:

Step 1: Pick an element, called a pivot, from the array.

Step 2: Partitioning: reorder the array so that all elements with values less than the pivot come before the pivot, while all elements with values greater than the pivot come after it (equal values can go either way). After this partitioning, the pivot is in its final position. This is called the partition operation.

Step 3: Recursively apply the above steps to the sub-array of elements with smaller values and separately to the sub-array of elements with greater values.

Source code: program to implement Quick sort

```
#include<iostream>
using namespace std;
void quicksort(int x[],int Lb,int Ub)
{
    int down,up,pivot,t;
    if(Lb<Ub)
    {
        down=Lb;
        up=Ub;
        pivot=down;
        while(down<up)
        {
            while((x[down]<=x[pivot])&&(down<Ub))down++;
            while(x[up]>x[pivot])up--;
            if(down<up)
            {
                t=x[down];
                x[down]=x[up];
                x[up]=t;
            }/*endif*/
        }
        t=x[pivot];
        x[pivot]=x[up];
        x[up]=t;
        quicksort( x,Lb,up-1);
        quicksort( x,up+1,Ub);
    }
}
int main()
{
    int n,i;
    int list[30];
    cout<<"enter no of elements\n";
    cin>>n;
    cout<<"enter "<<n<<" numbers ";
    for(i=0;i<n;i++)
    {
        cin>>list[i];
    }
    quicksort(list,0,n-1);
    cout<<" after sorting\n";
    for(i=0;i<n;i++)
    {
        cout<<list[i]<<endl;
    }
    return 0;
}
```

Results

iv) Insertion sort: It iterates, consuming one input element each repetition, and growing a sorted output list. Each iteration, insertion sort removes one element from the input data, finds the location it belongs within the sorted list, and inserts it there. It repeats until no input elements remain

ALGORITHM:

Step 1: start
Step 2: for i \leftarrow 1 to length(A)
Step 3: j \leftarrow i
Step 4: while j > 0 and A[j-1] > A[j]
Step 5: swap A[j] and A[j-1]
Step 6: j \leftarrow j - 1
Step 7: end while
Step 8: end for
Step9: stop

Source code: program to implement insertion sort

```
#include<iostream>
using namespace std;
void insertion_sort(int a[],int n)
{
    int i,t,pos;
    for(i=0;i<n;i++)
    {
        t=a[i];
        pos=i;
        while(pos>0&&a[pos-1]>t)
        {
            a[pos]=a[pos-1];
            pos--;
        }
        a[pos]=t;
    }
}
int main()
{
```

```
int n,i;
int list[30];
    cout<<"enter no of elements\n";
    cin>>n;
    cout<<"enter "<<n<<" numbers ";
    for(i=0;i<n;i++)
        cin>>list[i];
    insertion_sort(list,n);
    cout<<" after sorting\n";
    for(i=0;i<n;i++)
        cout<<list[i]<<endl;
return 0;
}
```

Results

Assignment:-

Task	date	sign	Remarks
1.What are the various time complexities of different sorting algorithms			
2.Write a program to implement all above sorting techniques in a single program. provide a menu for selection of various sorting techniques during runtime.			
3.Write a program to implement above sorting technique using dynamic memory allocation			
4.write a program to count no of operations performed in each step in all sorting algorithms			

Week 3: Write C++ programs to implement the following using an array. Stack ADT b) Queue ADT

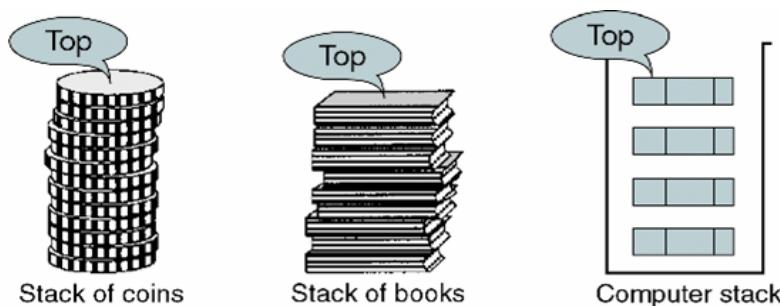

Aim: To implement Stack ADT and Queue ADT using an array

Description:

Stack: It is an ordered collection of data elements into which new elements may be inserted and from which elements may be deleted at one end called the “TOP” of stack.

- A stack is a last-in-first-out (LIFO) structure.
- Insertion operation is referred as “PUSH” and deletion operation is referred as “POP”.
- The most accessible element in the stack is the element at the position “TOP”.
- Stack must be created as empty.
- Whenever an element is pushed into stack, it must be checked whether the stack is full or not.
- Whenever an element is popped from stack, it must be checked whether the stack is empty or not.

We can implement the stack ADT either with array or linked list.

ALGORITHM: push()

```

Step 1: if top >= max-1 then
Step 2: Display the stack overflows
Step 3: else then
Step 4: top ++
Step 5: assign stack[top]=x
Step 6: Display element is inserted
    
```

ALGORITHM pop()

```

Step 1: if top == -1 then
Step 2: Display the stack is underflows
Step 3: else
Step 4: assign x=stack[top]
Step 5: top -
Step 6: return x
    
```

Source code: To implement Stack ADT using an array

```

#include<iostream>
using namespace std;
#include<stdlib.h>
#define max 50
template <class T>
    
```

```
class stack
{
private:
    T top,stk[50],item;
public:
    stack();
    void push();
    void pop();
    void display();
};

template <class T>
stack<T>::stack()
{
    top=-1;
}

//code to push an item into stack;
template <class T>
void stack<T>::push()
{
    if(top==max-1)

QUEUE

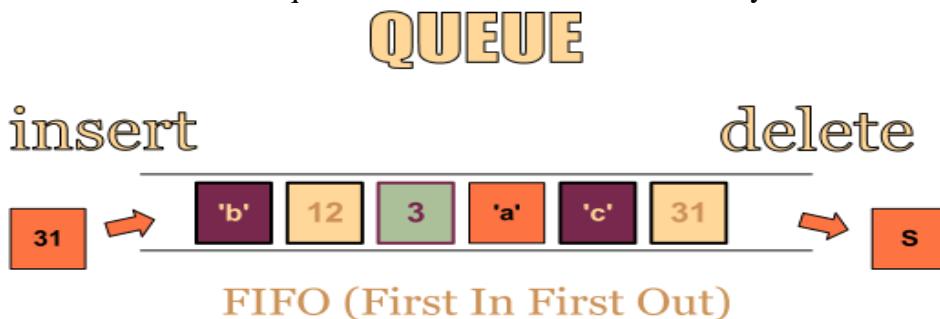

DESCRIPTION:

Queue is a data structure in which the elements are added at one end, called the rear, and deleted from the other end, called the front. A First In First Out data structure (FIFO). The rear of the queue is accessed whenever a new element is added to the queue, and the front of the queue is accessed whenever an element is deleted from the queue. As in a stack, the middle elements in the queue are in accessible, even if the queue elements are sorted in an array.

BASIC QUEUE OPERATIONS:

1. initializeQueue(): Initializes the queue to an empty state.
2. Determines whether the queue is empty. If the queue is empty, it returns the value true; otherwise, it returns the value false.
3. Determines whether the queue is full. If the queue is empty, it returns the value true; otherwise, it returns the value false.
4. rear: Returns the last element of the queue. Prior to this operation, the queue must exit.
5. front: Returns the front, that is, the first element of the queue. Priority to this operation, the queue must exit.

Queue can be stored either in an array or in linked list. We will consider both implementations. Because elements are added at one end and remove from the other end, we need two pointers to keep track of the front and rear of the queue, called queueFront and queueRear. Queues are restricted versions of arrays and linked lists. The middle terms of queue should not be accessed directly.

Source code: To implement Queue ADT using an array

```
#include<stdlib.h>
#include<iostream>
using namespace std;
#define max 5
template <class T>
class queue
{
private:T q[max],item;
    int front,rear;
public: queue();
    void insert_q();
    void delete_q();
    void display_q();
};
```

```
template <class T>
queue<T>::queue()
{
    front=rear=-1;
}

//code to insert an item into queue;
template <class T>
void queue<T> ::insert_q()
{
if(rear>=max-1)
    cout<<"queue Overflow...\n";
else
{
    if(front>rear)
        front=rear=-1;
    else
    {
        if(front== -1)
            front=0;
        rear++;
        cout<<"Enter an item to be inserted:";
        cin>>item;
        q[rear]=item;
        cout<<"inserted Sucesfully..into queue..\n";
    }
}
}

template <class T>
void queue<T>::delete_q()
{
if(front== -1||front>rear)
{
    front=rear=-1;
    cout<<"queue is Empty....\n";
}
else
{
    item=q[front];
    front++;
    cout<<item<<" is deleted Sucesfully....\n";
}
}

template <class T>
void queue<T>::display_q()
{
if(front== -1||front>rear)
{
    front=rear=-1;
    cout<<"queue is Empty....\n";
}
```

```

        else
        {
            for(int i=front;i<=rear;i++)
                cout<<"|"<<q[i]<"|<--";
        }
    }

int main()
{
    int choice;
    queue<int> q;
    while(1)
    {
        cout<<"\n\n*****Menu for QUEUE operations*****\n\n";
        cout<<"1.INSERT\n2.DELETE\n3.DISPLAY\n4.EXIT\n";
        cout<<"Enter Choice:";

        cin>>choice;
        switch(choice)
        {
            case 1:      q.insert_q();
                         break;
            case 2:      q.delete_q();
                         break;
            case 3:      cout<<"Elements in the queue are....\n";
                         q.display_q();
                         break;
            case 4:      exit(0);
            default:     cout<<"Invalid choice...Try again...\n";
        }
    }
    return 0;

2. Write a program to perform evaluation of postfix expression			
3. Write a program to convert given infix expression to post fix			

- Week 4: C++ programs to implement list ADT to perform following operations
- Insert an element into a list.
 - Delete an element from list
 - Search for a key element in list
 - Count number of nodes in list

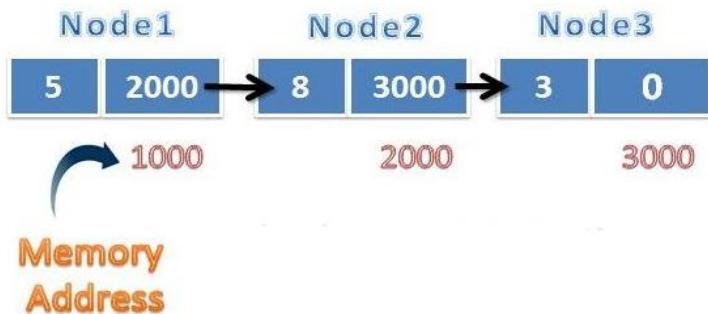

Aim: To implement list ADT to perform following operations

- Insert an element into a list.
- Delete an element from list
- Search for a key element in list
- Count number of nodes in list

Description:

List ADT

A **linked list** is a data structure consisting of a group of nodes which together represent a sequence. Each node is composed of a data part and a reference (in other words, a *link*) to the next node in the sequence.

The Linked List is a collection of elements called nodes, each node of which stores two items of information, i.e., data part and link field.

The data part of each node consists the data record of an entity.

The link field is a pointer and contains the address of next node.

The beginning of the linked list is stored in a pointer termed as head which points to the first node.

The head pointer will be passed as a parameter to any method, to perform an operation.

First node contains a pointer to second node, second node contains a pointer to the third node and so on.

The last node in the list has its next field set to NULL to mark the end of the list.

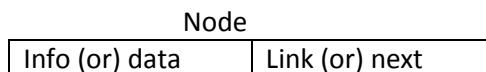

- There are several variants of linked lists. These are as follows:

- Singly linked list
- Circular linked list
- Doubly linked list
- Doubly circular linked list

SINGLE LINKED LIST:

Single Linked List is a collection of nodes. Each node contains 2 fields: I) info where the information is stored and ii) link which points to the next node in the list.

The node is like this:

The operations that can be performed on single linked lists includes: insertion, deletion and traversing the list.

Various operations on a single linked list are

- 1.Insertion of a node into list
- 2.Deletion of a node from list
- 3.Traversal of the list

Source code: To Implement LIST ADT in C++

```
#include<stdlib.h>

Assignment:-

Task	Date	Sign	Remark
1. Write a program to concatenate two linked lists			
2. Write a program to reverse a given linked list			
3. Write a program to generate two lists from a given linked list such that first list contains all elements in odd places and second list consists of all elements in even places			

Week 5: Write C++ programs to implement the following using a singly linked list.
a) Stack ADT b) Queue ADT

Aim: To implement Stack ADT and Queue ADT using a singly linked list.

Description:

A Stack is a collection of items in which new items may be deleted at end to implement stack using linked list we need to define a node which in turn consist of data a pointer to the next node. The advantage of representing stack using linked lists is that we can decide which end should be top of a stack. And since the array size is fixed, in the array (linear) representation of stack, only fixed number of elements can be pushed onto the stack. If in a program the number of elements to be pushed exceeds the size of the array, the program may terminate in an error. We must overcome these problems.

By using linked lists we can dynamically organize data (such as an ordered list). Therefore, logically the stack is never full. The stack is full only if we run out of memory space. In the below program we select front end as top of stack in which we can add or remove data.

Source code: To implement Stack ADT using a singly linked list.

```
#include<stdlib.h>
#include<iostream>
using namespace std;
template <class T>
class node
{
public:
    T data;
    node<T>*next;
};

template <class T>
class stack
{
private:
    T item;
    node<T> *top;
public: stack();
    void push();
    void pop();
    void display();
};
template <class T>
stack<T>::stack()
{
    top=NULL;
}
//code to push an item into stack;
template <class T>
```

```
void stack<T>::push()
{
node<T>*t;
node<T>*p;
cout<<"Enter an item to be pushed:";
cin>>item;
p=new node<T>;
p->data=item;
p->next=top;
top=p;
cout<<"\nPushed Sucesfully....\n";
}

template <class T>

{
node<T>*t;
if(top==NULL)
    cout<<"\nStack is Underflow";
else
{
    item=top->data;
    top=top->next;
    cout<<"\n"<<item<<" is poped Sucesfully....\n";
}
}

template <class T>
void stack<T>::display()
{
node<T>*t;
if(top==NULL)
    cout<<"\nStack Under Flow";
else
{
    cout<<"\nElements in the Stack are....\n";
    t=top;
    while(t!=NULL)
    {
        cout<<"|"<<t->data<<"|\n";
        cout<<"----\n";
        t=t->next;
    }
}
}

int main()
{
int choice;
stack<int>st;
while(1)
{
```

```

cout<<"\n\n***Menu for Skack operations***\n\n";
cout<<"1.PUSH\n2.POP\n3.DISPLAY\n4.EXIT\n";
cout<<"Enter Choice:";
cin>>choice;
switch(choice)
{
    case 1:
        st.push();
        break;
    case 2:
        st.pop();
        break;
    case 3: st.display();
        break;
    case 4:
        exit(0);
    default:cout<<"Invalid choice...Try again...\n";
}
}
}

```

- Week 7: Write a C++ program to perform the following operations:
- Insert an element into a binary search tree.
 - Delete an element from a binary search tree.
 - Search for a key element in a binary search tree.

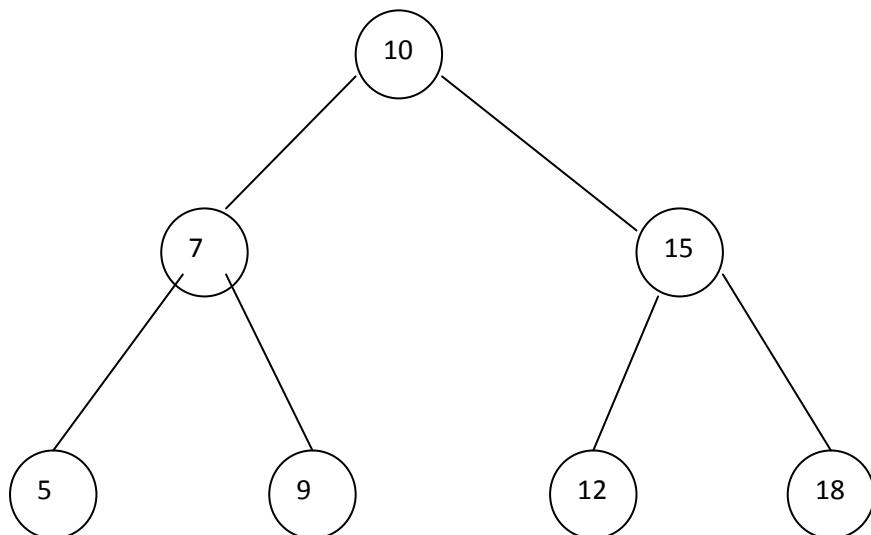

Description:

Binary Search Tree:

So to make the searching algorithm faster in a binary tree we will go for building the binary search tree. The binary search tree is based on the binary search algorithm. While creating the binary search tree the data is systematically arranged.

That means values at

left sub-tree < root node value < right sub-tree values.

1.What is a binary tree& binary search tree			
2.Applications of binary search tree			

Week 8 : Write C++ programs for implementing the following sorting methods:
a) Merge sort b) Heap sort

Aim: To implement Merge sort and Heap sort

Description:

Merge sort is an $O(n \log n)$ comparison-based sorting algorithm. It is stable, meaning that it preserves the input order of equal elements in the sorted output. It is an example of the divide and conquer algorithmic paradigm. Merge sort is so inherently sequential that it's practical to run it using slow tape drives as input and output devices. It requires very little memory, and the memory required does not change with the number of data elements. If you have four tape drives, it works as follows:

1. Divide the data to be sorted in half and put half on each of two tapes
2. Merge individual pairs of records from the two tapes; write two-record chunks alternately to each of the two output tapes
3. Merge the two-record chunks from the two output tapes into four-record chunks; write these alternately to the original two input tapes
4. Merge the four-record chunks into eight-record chunks; write these alternately to the original two output tapes
5. Repeat until you have one chunk containing all the data, sorted --- that is, for $\log n$ passes, where n is the number of records.

Conceptually, merge sort works as follows:

1. Divide the unsorted list into two sublists of about half the size
2. Divide each of the two sublists recursively until we have list sizes of length 1, in which case the list itself is returned
3. Merge the two sublists back into one sorted list.

Source code:

```
#include<iostream>
using namespace std;
#define max 15
template<class T>
void merge(T a[],int l,int m,int u)
{
    T b[max];
    int i,j,k;
    i=l; j=m+1;
    k=l;
    while((i<=m)&&(j<=u))
    {
        if(a[i]<=a[j])
            b[k]=a[i];
        else
            b[k]=a[j];
        i++;
        k++;
        if(j<=u)
            b[k]=a[j];
        j++;
    }
}
```

```

if(a[i]<=a[j])
{
    b[k]=a[i];
    ++i;
}
else
{
    b[k]=a[j];
    ++j;
}
++k;
}
if(i>m)
{
    while(j<=u)
    {
        b[k]=a[j];
        ++j;
        ++k;
    }
}
else
{
    while(i<=m)
    {
        b[k]=a[i];
        ++i;
        ++k;
    }
}
for(int r=l;r<=u;r++)
a[r]=b[r];
}

```

```

template <class T>
void mergesort(T a[],int p,int q)
{
int mid;
if(p<q)
{
    mid=(p+q)/2;
    mergesort(a,p,mid);
    mergesort(a,mid+1,q);
    merge(a,p,mid,q);
}
}

```

```

int main()
{

```

```
int n,i;
int list[30];
    cout<<"enter no of elements\n";
    cin>>n;
    cout<<"enter "<<n<<" numbers ";
    for(i=0;i<n;i++)
        cin>>list[i];
    mergesort (list,0,n-1);
    cout<<" after sorting\n";
    for(i=0;i<n;i++)
        cout<<list[i]<<endl;
return 0;
}
```

Results

HEAP SORT

Heap sort is a method in which a binary tree is used. In this method first the heap is created using binary tree and then heap is sorted using priority queue.

Source code:// C++ program for implementation of Heap Sort

```
#include <iostream>
using namespace std;

// To heapify a subtree rooted with node i which is
// an index in arr[]. n is size of heap
void heapify(int arr[], int n, int i)
{
    int largest = i; // Initialize largest as root
    int l = 2*i + 1; // left = 2*i + 1
    int r = 2*i + 2; // right = 2*i + 2
```

```
    // If left child is larger than root
    if (l < n && arr[l] > arr[largest])
        largest = l;
```

```
    // If right child is larger than largest so far
```

```
if (r < n && arr[r] > arr[largest])
    largest = r;

// If largest is not root
if (largest != i)
{
    swap(arr[i], arr[largest]);

    // Recursively heapify the affected sub-tree
    heapify(arr, n, largest);
}

// main function to do heap sort
void heapSort(int arr[], int n)
{
    // Build heap (rearrange array)
    for (int i = n / 2 - 1; i >= 0; i--)
        heapify(arr, n, i);

    // One by one extract an element from heap
    for (int i=n-1; i>=0; i--)
    {
        // Move current root to end
        swap(arr[0], arr[i]);

        // call max heapify on the reduced heap
        heapify(arr, i, 0);
    }
}

/* A utility function to print array of size n */
void printArray(int arr[], int n)
{
    for (int i=0; i<n; ++i)
        cout << arr[i] << " ";
    cout << "\n";
}

int main()
{
int n,i;
int list[30];
    cout<<"enter no of elements\n";
    cin>>n;
    cout<<"enter "<<n<<" numbers ";
    for(i=0;i<n;i++)
        cin>>list[i];
    heapSort(list, n);
    cout << "Sorted array is \n";
```

```
printArray(list, n);
return 0;
}
```

Assignment:-

Task	Date	Sign	Remark
1. Write a program to explain time complexity in Merge sort			
2. Explain about heap sort			

Week 9 : Write C++ programs that use recursive functions to traverse the given binary tree in Preorder b) inorder and c) postorder

Aim: To implement Binary tree traversals

Description:

It is often convenient to a single list containing all the nodes in a tree. This list may correspond to an order in which the nodes should be visited when the tree is being searched. We define three such lists here, the **preorder**, **postorder** and **inorder** traversals of the tree. The definitions themselves are recursive:

- if T is the empty tree, then the empty list is the preorder, the inorder and the postorder traversal associated with T ;
- if $T = [N]$ consists of a single node, the list $[N]$ is the preorder, the inorder and the postorder traversal associated with T ;
- otherwise, T contains a root node n , and subtrees T_1, \dots, T_n : and
 - the *preorder* traversal of the nodes of T is the list containing N , followed, in order by the preorder traversals of T_1, \dots, T_n ;
 - the *inorder* traversal of the nodes of T is the list containing the inorder traversal of T_1 followed by N followed in order by the inorder traversal of each of T_2, \dots, T_n .
 - the *postorder* traversal of the nodes of T is the list containing in order the postorder traversal of each of T_1, \dots, T_n , followed by N .

Source code:

Assignment:-

Task	Date	Sign	Remark
1. What is a height balanced tree			
2. Explain What is the necessity of rotations in AVL tree.			

Week 12 : Write a C++ program to implement all the functions of a dictionary (ADT)

Aim: To implement all the functions of a dictionary (ADT)

Source code:

```
#include<stdlib.h>
#include<iostream.h>
class node
{
public: int key;
        int value;
        node*next;
};

class dictionary:public node
{
    int k,data;
    node *head;
public: dictionary();
    void insert_d();
    void delete_d();
    void display_d();
};

dictionary::dictionary()
{
    head=NULL;
}

//code to push an val into dictionary;
void dictionary::insert_d()
{
node *p,*curr,*prev;
cout<<"Enter an key and value to be inserted:";
cin>>k;
cin>>data;
p=new node;
p->key=k;
p->value=data;
p->next=NULL;
if(head==NULL)
    head=p;
else
{
curr=head;
while((curr->key<p->key)&&(curr->next!=NULL))
{ prev=curr;
    curr=curr->next;
}
if(curr->next==NULL)
{
    if(curr->key<p->key)
        { curr->next=p;
            prev=curr;
        }
}
```

```

        else { p->next=prev->next;
            prev->next=p;
        }
    }
else
{
    p->next=prev->next;
    prev->next=p;
}
cout<<"\nInserted into dictionary Sucesfully....\n";
}

void dictionary::delete_d( )
{
node*curr,*prev;
    cout<<"Enter key value that you want to delete...";
    cin>>k;
    if(head==NULL)
        cout<<"\ndictionary is Underflow";
    else
    {
        curr=head;
        while(curr!=NULL)
        {
            if(curr->key==k)
                break;
            prev=curr;
            curr=curr->next;
        }
    }
    if(curr==NULL)
        cout<<"Node not found...";
    else
    {
        if(curr==head)
            head=curr->next;
        else
            prev->next=curr->next;
        delete curr;
        cout<<"Item deleted from dictionary...";
    }
}
void dictionary::display_d( )
{
node*t;
    if(head==NULL)
        cout<<"\ndictionary Under Flow";
    else
    {
        cout<<"\nElements in the dictionary are....\n";
        t=head;
    }
}

```

```

while(t!=NULL)
{
    cout<<"<<t->key<<","<<t->value<<>";
    t=t->next;
}
}

int main()
{
int choice;
dictionary d1;
    while(1)
    {
        cout<<"\n\n***Menu for Dictionary operations***\n\n";
        cout<<"1.Insert\n2.Delete\n3.DISPLAY\n4.EXIT\n";
        cout<<"Enter Choice:";

        cin>>choice;
        switch(choice)
        {
            case 1: d1.insert_d();
                      break;
            case 2: d1.delete_d();
                      break;
            case 3: d1.display_d();
                      break;
            case 4: exit(0);
            default:cout<<"Invalid choice...Try again...\n";
        }
    }
}

```
