MALLA REDDY COLLEGE OF ENGINEERING & TECHNOLOGY

(Autonomous Institution – UGC, Govt. of India)

Recognized under 2(f) and 12 (B) of UGC ACT 1956

(Affiliated to JNTUH, Hyderabad, Approved by AICTE - Accredited by NBA &
NAAC – ‘A’ Grade - ISO 9001:2015 Certified)

Maisammaguda, Dhulapally (Post Via. Hakimpet), Secunderabad – 500100,
Telangana State, India

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Vision

To acknowledge quality education and instill high patterns of discipline making the students technologically superior and ethically strong which involves the improvement in the quality of life in human race.

Mission

- ❖ To achieve and impart holistic technical education using the best of infrastructure, outstanding technical and teaching expertise to establish the students in to competent and confident engineers.
- ❖ Evolving the center of excellence through creative and innovative teaching learning practices for promoting academic achievement to produce internationally accepted competitive and world class professionals.

PROGRAMME EDUCATIONAL OBJECTIVES (PEOs)

PEO1 – ANALYTICAL SKILLS

- ❖ To facilitate the graduates with the ability to visualize, gather information, articulate, analyze, solve complex problems, and make decisions. These are essential to address the challenges of complex and computation intensive problems increasing their productivity.

PEO2 – TECHNICAL SKILLS

- ❖ To facilitate the graduates with the technical skills that prepare them for immediate employment and pursue certification providing a deeper understanding of the technology in advanced areas of computer science and related fields, thus encouraging to pursue higher education and research based on their interest.

PEO3 – SOFT SKILLS

- ❖ To facilitate the graduates with the soft skills that include fulfilling the mission, setting goals, showing self-confidence by communicating effectively, having a positive attitude, get involved in team-work, being a leader, managing their career and their life.

PEO4 – PROFESSIONAL ETHICS

- ❖ To facilitate the graduates with the knowledge of professional and ethical responsibilities by paying attention to grooming, being conservative with style, following dress codes, safety codes, and adapting themselves to technological advancements.

PROGRAM SPECIFIC OUTCOMES (PSOs)

After the completion of the course, B. Tech Computer Science and Engineering, the graduates will have the following Program Specific Outcomes:

1. Fundamentals and critical knowledge of the Computer System:- Able to Understand the working principles of the computer System and its components , Apply the knowledge to build, asses, and analyze the software and hardware aspects of it .
2. The comprehensive and Applicative knowledge of Software Development: Comprehensive skills of Programming Languages, Software process models, methodologies, and able to plan, develop, test, analyze, and manage the software and hardware intensive systems in heterogeneous platforms individually or working in teams.
3. Applications of Computing Domain & Research: Able to use the professional, managerial, interdisciplinary skill set, and domain specific tools in development processes, identify the research gaps, and provide innovative solutions to them.

PROGRAM OUTCOMES (POs)

Engineering Graduates should possess the following:

1. **Engineering knowledge:** Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.
2. **Problem analysis:** Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.
3. **Design / development of solutions:** Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
4. **Conduct investigations of complex problems:** Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.
5. **Modern tool usage:** Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.
6. **The engineer and society:** Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.
7. **Environment and sustainability:** Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
8. **Ethics:** Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.
9. **Individual and team work:** Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
10. **Communication:** Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
11. **Project management and finance:** Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multi disciplinary environments.
12. **Life- long learning:** Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

GENERAL LABORATORY INSTRUCTIONS

1. Students are advised to come to the laboratory at least 5 minutes before (to the starting time), those who come after 5 minutes will not be allowed into the lab.
2. Plan your task properly much before to the commencement, come prepared to the lab with the synopsis / program / experiment details.
3. Student should enter into the laboratory with:
 - a. Laboratory observation notes with all the details (Problem statement, Aim, Algorithm, Procedure, Program, Expected Output, etc.) filled in for the lab session.
 - b. Laboratory Record updated up to the last session experiments and other utensils (if any) needed in the lab.
 - c. Proper Dress code and Identity card.
4. Sign in the laboratory login register, write the TIME-IN, and occupy the computer system allotted to you by the faculty.
5. Execute your task in the laboratory, and record the results / output in the lab observation note book, and get certified by the concerned faculty.
6. All the students should be polite and cooperative with the laboratory staff, must maintain the discipline and decency in the laboratory.
7. Computer labs are established with sophisticated and high end branded systems, which should be utilized properly.
8. Students / Faculty must keep their mobile phones in SWITCHED OFF mode during the lab sessions. Misuse of the equipment, misbehaviors with the staff and systems etc., will attract severe punishment.
9. Students must take the permission of the faculty in case of any urgency to go out; if anybody found loitering outside the lab / class without permission during working hours will be treated seriously and punished appropriately.
10. Students should LOG OFF/ SHUT DOWN the computer system before he/she leaves the lab after completing the task (experiment) in all aspects. He/she must ensure the system / seat is kept properly.

HEAD OF THE DEPARTMENT

PRINCIPAL

INDEX

S.No	Name of the program	Page No
1.	Write a Python program for class, Flower, that has three instance variables of type str, int, and float that respectively represent the name of the flower, its number of petals, and its price. Your class must include a constructor method that initializes each variable to an appropriate value, and your class should include methods for setting the value of each type, and retrieving the value of each type.	1
2.	Develop an inheritance hierarchy based upon a Polygon class that has abstract methods area() and perimeter(). Implement classes Triangle, Quadrilateral, Pentagon, that extend this base class, with the obvious meanings for the area() and perimeter() methods. Write a simple program that allows users to create polygons of the various types and input their geometric dimensions, and the program then outputs their area and perimeter.	5
3.	Write a python program to implement Method Overloading and Method Overriding.	8
4.	Write a program for Linear Search and Binary search	11
5.	Write a program to implement Bubble Sort and Selection Sort	14
6.	Write a program to implement Merge sort and Quick sort	16
7.	Write a program to implement Stacks and Queues	19
8.	Write a program to implement Singly Linked List	25
9.	Write a program to implement Doubly Linked List	33
10.	Write a python program to implement DFS & BFS graph Traversal Techniques.	41
11.	Write a program to implement Binary Search Tree	47
12.	Write a program to implement B+ Tree	53

1. Write a Python program for class, Flower, that has three instance variables of type str, int, and float, that respectively represent the name of the flower, its number of petals, and its price. Your class must include a constructor method that initializes each variable to an appropriate value, and your class should include methods for setting the value of each type, and retrieving the value of each type.

Program:

```
class Flower:
#Common base class for all Flowers
    def __init__(self, petalName, petalNumber, petalPrice):
        self.name = petalName
        self.petals = petalNumber
        self.price = petalPrice

    def setName(self, petalName):
        self.name = petalName

    def setPetals(self, petalNumber):
        self.petals = petalNumber

    def setPrice(self, petalPrice):
        self.price = petalPrice

    def getName(self):
        return self.name

    def getPetals(self):
        return self.petals

    def getPrice(self):
        return self.price

#This would create first object of Flower class
f1 = Flower("Sunflower", 2, 1000)
print ("Flower Details:")
print ("Name: ", f1.getName())
print ("Number of petals:", f1.getPetals())
print ("Price:", f1.getPrice())

print ("\n")

#This would create second object of Flower class
f2 = Flower("Rose", 5, 2000)
f2.setPrice(3333)
f2.setPetals(6)
print ("Flower Details:")
print ("Name: ", f2.getName())
print ("Number of petals:", f2.getPetals())
print ("Price:", f2.getPrice())
```

Exercise Programs:

2. Develop an inheritance hierarchy based upon a Polygon class that has abstract methods `area()` and `perimeter()`. Implement classes `Triangle`, `Quadrilateral`, `Pentagon`, that extend this base class, with the obvious meanings for the `area()` and `perimeter()` methods. Write a simple program that allows users to create polygons of the various types and input their geometric dimensions, and the program then outputs their area and perimeter.

Program:

```
from abc import abstractmethod, ABCMeta
import math

class Polygon(metaclass = ABCMeta):
    def __init__(self, side_lengths = [1,1,1], num_sides = 3):
        self._side_lengths = side_lengths
        self._num_sides = 3

    @abstractmethod
    def area(self):
        pass

    @abstractmethod
    def perimeter(self):
        pass

    def __repr__(self):
        return (str(self._side_lengths))

class Triangle(Polygon):
    def __init__(self, side_lengths):
        super().__init__(side_lengths, 3)
        self._perimeter = self.perimeter()
        self._area = self.area()

    def perimeter(self):
        return(sum(self._side_lengths))

    def area(self):

        #Area of Triangle
        s = self._perimeter/2
        product = s
        for i in self._side_lengths:
            product*=(s-i)
        return product**0.5

class Quadrilateral(Polygon):
    def __init__(self, side_lengths):
        super().__init__(side_lengths, 4)
        self._perimeter = self.perimeter()
```

```
        self._area = self.area()

def perimeter(self):
    return(sum(self._side_lengths))

def area(self):

    # Area of an irregular Quadrilateral
    semiperimeter = sum(self._side_lengths) / 2
    return math.sqrt((semiperimeter - self._side_lengths[0]) *
                    (semiperimeter - self._side_lengths[1]) *
                    (semiperimeter - self._side_lengths[2]) *
                    (semiperimeter - self._side_lengths[3]))

class Pentagon(Polygon):
    def __init__(self, side_lengths):
        super().__init__(side_lengths, 5)
        self._perimeter = self.perimeter()
        self._area = self.area()

    def perimeter(self):
        return((self._side_lengths) * 5)

    def area(self):

        # Area of a regular Pentagon
        a = self._side_lengths
        return (math.sqrt(5 * (5 + 2 * (math.sqrt(5)))) * a * a) /
            4

#object of Triangle
t1 = Triangle([1,2,2])
print(t1.perimeter(),
      t1.area())

#object of Quadrilateral
q1 = Quadrilateral([1,1,1,1])
print(q1.perimeter(),
      q1.area())
```

Output:

Signature of the Faculty

Exercise Programs:

3. Write a python program to implement method overloading and method overriding.

Method Overloading

Method overloading is an OOPS concept which provides ability to have several methods having the same name with in the class where the methods differ in types or number of arguments passed.

Method overloading in Python

Method overloading in its traditional sense (as defined above) as exists in other languages like method overloading in Java doesn't exist in Python.

In Python if you try to overload a function by having two or more functions having the same name but different number of arguments only the last defined function is recognized, calling any other overloaded function results in an error.

Achieving method overloading

Since using the same method name again to overload the method is not possible in Python, so achieving method overloading in Python is done by having a single method with several parameters. Then you need to check the actual number of arguments passed to the method and perform the operation accordingly.

Program:

```
class OverloadDemo:
    # sum method with default as None for parameters
    def sum(self, a=None, b=None, c=None):
        # When three params are passed
        if a!=None and b!=None and c!=None:
            s = a + b + c
            print('Sum = ', s)
        # When two params are passed
        elif a!=None and b!=None:
            s = a + b
            print('Sum = ', s)

od = OverloadDemo()
od.sum(7, 8)
od.sum(7, 8, 9)
```

Output:

Method overriding - Polymorphism through inheritance

Method overriding provides ability to change the implementation of a method in a child class which is already defined in one of its super class. If there is a method in a super class and method having the same name and same number of arguments in a child class then the child class method is said to be overriding the parent class method.

When the method is called with parent class object, method of the parent class is executed. When method is called with child class object, method of the child class is executed. So the appropriate overridden method is called based on the object type, which is an example of Polymorphism.

Program:

```
class Person:
    def __init__(self, name, age):
        self.name = name
        self.age = age

    def displayData(self):
        print('In parent class displayData method')
        print(self.name)
        print(self.age)

class Employee(Person):
    def __init__(self, name, age, id):
        # calling constructor of super class
        super().__init__(name, age)
        self.empId = id

    def displayData(self):
        print('In child class displayData method')
        print(self.name)
        print(self.age)
        print(self.empId)

#Person class object
person = Person('Karthik Shaurya', 26)
person.displayData()
#Employee class object
emp = Employee('Karthik Shaurya', 26, 'E317')
emp.displayData()
```

Output:

Signature of the Faculty

4. Write a program for Linear Search and Binary search

Linear Search Program:

```
def linearSearch(target, List):
    position = 0
    global iterations
    iterations = 0
    while position < len(List):
        iterations += 1
        if target == List[position]:
            return position
        position += 1
    return -1

if __name__ == '__main__':
    List = [1, 2, 3, 4, 5, 6, 7, 8]
    target = 3
    answer = linearSearch(target, List)
    if answer != -1:
        print('Target found at index :', answer, 'in',
              iterations, 'iterations')
    else:
        print('Target not found in the list')
```

Output:

Binary Search Program:

```
def binarySearch(target, List):  
  
    left = 0  
    right = len(List) - 1  
    global iterations  
    iterations = 0  
  
    while left <= right:  
        iterations += 1  
        mid = (left + right) // 2  
        if target == List[mid]:  
            return mid  
        elif target < List[mid]:  
            right = mid - 1  
        else:  
            left = mid + 1  
    return -1  
  
if __name__ == '__main__':  
    List = [1, 2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14]  
    target = 12  
    answer = binarySearch(target, List)  
    if(answer != -1):  
        print('Target',target,'found at position', answer, 'in',  
              iterations,'iterations')  
    else:  
        print('Target not found')
```

Output:

Signature of the Faculty

Exercise Programs:

5. Write a program to implement Bubble Sort and Selection Sort

Bubble Sort Program:

```
def bubble_sort(alist):
    for i in range(len(alist) - 1, 0, -1):
        no_swap = True
        for j in range(0, i):
            if alist[j + 1] < alist[j]:
                alist[j], alist[j + 1] = alist[j + 1], alist[j]
                no_swap = False
        if no_swap:
            return

alist = input('Enter the list of numbers: ').split()
alist = [int(x) for x in alist]
bubble_sort(alist)
print('Sorted list: ', alist)
```

Output:

Selection Sort Program:

```
def selection_sort(alist):
    for i in range(0, len(alist) - 1):
        smallest = i
        for j in range(i + 1, len(alist)):
            if alist[j] < alist[smallest]:
                smallest = j
        alist[i], alist[smallest] = alist[smallest], alist[i]

alist = input('Enter the list of numbers: ').split()
alist = [int(x) for x in alist]
selection_sort(alist)
print('Sorted list: ', alist)
```

Output:

Signature of the Faculty

Exercise Programs:

6. Write a program to implement Merge sort and Quick sort

Merge Sort Program:

```
def merge_sort(alist, start, end):
    '''Sorts the list from indexes start to end - 1 inclusive.'''
    if end - start > 1:
        mid = (start + end)//2
        merge_sort(alist, start, mid)
        merge_sort(alist, mid, end)
        merge_list(alist, start, mid, end)

def merge_list(alist, start, mid, end):
    left = alist[start:mid]
    right = alist[mid:end]
    k = start
    i = 0
    j = 0
    while (start + i < mid and mid + j < end):
        if (left[i] <= right[j]):
            alist[k] = left[i]
            i = i + 1
        else:
            alist[k] = right[j]
            j = j + 1
        k = k + 1
    if start + i < mid:
        while k < end:
            alist[k] = left[i]
            i = i + 1
            k = k + 1
    else:
        while k < end:
            alist[k] = right[j]
            j = j + 1
            k = k + 1

alist = input('Enter the list of numbers: ').split()
alist = [int(x) for x in alist]
merge_sort(alist, 0, len(alist))
print('Sorted list: ', alist)
```

Output:

Signature of the Faculty

Quick Sort Program:

```
def quicksort(alist, start, end):
    '''Sorts the list from indexes start to end - 1 inclusive.'''
    if end - start > 1:
        p = partition(alist, start, end)
        quicksort(alist, start, p)
        quicksort(alist, p + 1, end)

def partition(alist, start, end):
    pivot = alist[start]
    i = start + 1
    j = end - 1

    while True:
        while (i <= j and alist[i] <= pivot):
            i = i + 1
        while (i <= j and alist[j] >= pivot):
            j = j - 1

        if i <= j:
            alist[i], alist[j] = alist[j], alist[i]
        else:
            alist[start], alist[j] = alist[j], alist[start]
            return j

alist = input('Enter the list of numbers: ').split()
alist = [int(x) for x in alist]
quicksort(alist, 0, len(alist))
print('Sorted list: ', alist)
```

Output:

Signature of the Faculty

7. Write a program to implement Stacks and Queues

Stack Program:

```
# Custom stack implementation in Python
class Stack:

    # Constructor to initialize the stack
    def __init__(self, size):
        self.arr = [None] * size
        self.capacity = size
        self.top = -1

    # Function to add an element `x` to the stack
    def push(self, x):
        if self.isFull():
            print("Stack Overflow!! Calling exit()...")
            exit(1)

        print("Inserting", x, "into the stack...")
        self.top = self.top + 1
        self.arr[self.top] = x

    # Function to pop a top element from the stack
    def pop(self):
        # check for stack underflow
        if self.isEmpty():
            print("Stack Underflow!! Calling exit()...")
            exit(1)

        print("Removing", self.peak(), "from the stack")

        #decrease stack size by 1 and (optionally) return the popped element
        top = self.arr[self.top]
        self.top = self.top - 1
        return top

    # Function to return the top element of the stack
    def peek(self):
        if self.isEmpty():
            exit(1)
        return self.arr[self.top]

    # Function to return the size of the stack
    def size(self):
        return self.top + 1

    # Function to check if the stack is empty or not
    def isEmpty(self):
        return self.size() == 0
```

```
# Function to check if the stack is full or not
def isFull(self):
    return self.size() == self.capacity

if __name__ == '__main__':

    stack = Stack(3)

    stack.push(1)      # Inserting 1 in the stack
    stack.push(2)      # Inserting 2 in the stack

    stack.pop()        # removing the top element (2)
    stack.pop()        # removing the top element (1)

    stack.push(3)      # Inserting 3 in the stack

    print("Top element is", stack.peek())
    print("The stack size is", stack.size())

    stack.pop()        # removing the top element (3)

    # check if the stack is empty
    if stack.isEmpty():
        print("The stack is empty")
    else:
        print("The stack is not empty")
```

Output:

Queue Program:

```
# Custom queue implementation in Python
class Queue:

    # Initialize queue
    def __init__(self, size):
        self.q = [None] * size          # list to store queue elements
        self.capacity = size           # maximum capacity of the queue
        self.front = 0                 # front points to the front element in the queue
        self.rear = -1                 # rear points to the last element in the queue
        self.count = 0                 # current size of the queue

    # Function to dequeue the front element
    def pop(self):
        # check for queue underflow
        if self.isEmpty():
            print("Queue Underflow!! Terminating process.")
            exit(1)

        print("Removing element...", self.q[self.front])

        self.front = (self.front + 1) % self.capacity
        self.count = self.count - 1

    # Function to add an element to the queue
    def append(self, value):
        # check for queue overflow
        if self.isFull():
            print("Overflow!! Terminating process.")
            exit(1)
