MALLA REDDY COLLEGE OF ENGINEERING & TECHNOLOGY (Autonomous Institution – UGC, Govt. of India)

Recognized under 2(f) and 12(B) of UGC ACT 1956

(Affiliated to JNTUH, Hyderabad, Approved by AICTE-Accredited by NBA & NAAC – 'A' Grade - ISO 9001:2015 Certified) Maisammaguda, Dhulapally (Post Via. Hakimpet), Secunderabad–500100, Telangana State, India

Department of Computer Science and Engineering

EMERGING TECHNOLOGIES

Vision

"To be at the forefront of Emerging Technologies and to evolve as a Centre of Excellence in Research, Learning and Consultancy to foster the students into globally competent professionals useful to the Society."

Mission

The department of CSE (Emerging Technologies) is committed to:

- To offer highest Professional and Academic Standards in terms of Personal growth and satisfaction.
- Make the society as the hub of emerging technologies and thereby capture opportunities in new age technologies.
- To create a benchmark in the areas of Research, Education and Public Outreach.
- To provide students a platform where independent learning and scientific study are encouraged with emphasis on latest engineering techniques.

QUALITY POLICY

- To pursue continual improvement of teaching learning process of Undergraduate and Post Graduate programs in Engineering & Management vigorously.
- To provide state of art infrastructure and expertise to impart the quality education and research environment to students for a complete learning experiences.
- Developing students with a disciplined and integrated personality.
- To offer quality relevant and cost effective programmes to produce engineers as per requirements of the industry need.

PROGRAMME EDUCATIONAL OBJECTIVES (PEOs)

PEO1 – ANALYTICAL SKILLS

• To facilitate the graduates with the ability to visualize, gather information, articulate, analyze, solve complex problems, and make decisions. These are essential to address the challenges of complex and computation intensive problems increasing their productivity.

PEO2 – TECHNICAL SKILLS

• To facilitate the graduates with the technical skills that prepare them for immediate employment and pursue certification providing a deeper understanding of the technology in advanced areas of computer science and related fields, thus encouraging to pursue higher education and researchbased on their interest.

PEO3 – SOFT SKILLS

• To facilitate the graduates with the soft skills that include fulfilling the mission, setting goals, showing self-confidence by communicating effectively, having a positive attitude, get involved in team-work, being a leader, managing their career and their life.

PEO4 – PROFESSIONAL ETHICS

• To facilitate the graduates with the knowledge of professional and ethical responsibilities by paying attention to grooming, being conservative with style, following dress codes, safety codes, and adapting themselves to technological advancements.

PROGRAM SPECIFIC OUTCOMES (PSOs)

After the completion of the course, B. Tech Computer Science and Engineering, the graduates will have the following Program Specific Outcomes:

- 1. Fundamentals and critical knowledge of the Computer System: Able to Understand the working principles of the computer System and its components, Apply the knowledge to build, asses, and analyze the software and hardware aspects of it.
- 2. The comprehensive and Applicative knowledge of Software Development: Comprehensive skills of Programming Languages, Software process models, methodologies, and able to plan, develop, test, analyze, and manage the software and hardware intensive systems in heterogeneous platforms individually or working in teams.
- 3. Applications of Computing Domain & Research: Able to use the professional, managerial, interdisciplinary skill set, and domain specific tools in development processes, identify the research gaps, and provide innovative solutions to them.

PROGRAM OUTCOMES (POs)

Engineering Graduates should possess the following:

- 1. **Engineering knowledge**: Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.
- 2. **Problem analysis**: Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.
- 3. **Design / development of solutions**: Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
- 4. **Conduct investigations of complex problems**: Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.
- 5. **Modern tool usage**: Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.
- 6. **The engineer and society**: Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.
- 7. **Environment and sustainability**: Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
- 8. **Ethics**: Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.
- 9. **Individual and team work**: Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
- 10. **Communication**: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
- 11. **Project management and finance**: Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multi disciplinary environments.
- 12. Life- long learning: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

MALLA REDDY COLLEGE OF ENGINEERING & TECHNOLOGY

Maisammaguda, Dhulapally Post, Via Hakimpet, Secunderabad – 500100

Department of Computer Science and Engineering (Emerging Technologies)

GENERAL LABORATORY INSTRUCTIONS

- 1. Students are advised to come to the Laboratory at least 5 minutes before (to the starting time), those who come after 5 minutes will not be allowed into the Manual.
- 2. Plan your task properly much before to the commencement, come prepared to the Manual with thesynopsis / program / experiment details.
- 3. Student should enter into the Laboratory with:
- a. Laboratory observation notes with all the details (Problem statement, Aim, Algorithm, Procedure, Program, Expected Output, etc.,) filled in for the Manual session.
- b. Laboratory Record updated up to the last session experiments and other utensils (if any) needed in the Manual.
- c. Proper Dress code and Identity card.
- 4. Sign in the Laboratory login register, write the TIME-IN, and occupy the computer system allotted to you by the faculty.
- 5. Execute your task in the Laboratory, and record the results / output in the Manual observation note book, and get certified by the concerned faculty.
- 6. All the students should be polite and cooperative with the Laboratory staff, must maintain the discipline and decency in the Laboratory.
- 7. Computer Manuals are established with sophisticated and high end branded systems, which should be utilized properly.
- 8. Students / Faculty must keep their mobile phones in SWITCHED OFF mode during the Manual sessions. Misuse of the equipment, misbehaviors with the staff and systems etc., will attract severe punishment.
- 9. Students must take the permission of the faculty in case of any urgency to go out; if anybody found loitering outside the Manual / class without permission during working hours will be treated seriously and punished appropriately.
- 10. Students should LOG OFF/ SHUT DOWN the computer system before he/she leaves the Manual after completing the task (experiment) in all aspects. He/she must ensure the system / seat is kept properly.

Exercise Programs:

3. Write a python program to implement method overloading and method overriding.

Method Overloading

Method overloading is an OOPS concept which provides ability to have several methods having the same name with in the class where the methods differ in types or number of arguments passed.

Method overloading in Python

Method overloading in its traditional sense (as defined above) as exists in other languages like method overloading in Java doesn't exist in Python.

In Python if you try to overload a function by having two or more functions having the same name but different number of arguments only the last defined function is recognized, calling any other overloaded function results in an error.

Achieving method overloading

Since using the same method name again to overload the method is not possible in Python, so achieving method overloading in Python is done by having a single method with several parameters. Then you need to check the actual number of arguments passed to the method and perform the operation accordingly.

Program:

```
class OverloadDemo:
    # sum method with default as None for parameters
    def sum(self, a=None, b=None, c=None):
        # When three params are passed
        if a!=None and b!=None and c!=None:
            s = a + b + c
            print('Sum = ', s)
        # When two params are passed
        elif a!=None and b!=None:
            s = a + b
            print('Sum = ', s)
    od = OverloadDemo()
    od.sum(7, 8)
    od.sum(7, 8, 9)
```

Output:

Method overriding - Polymorphism through inheritance

Method overriding provides ability to change the implementation of a method in a child class which is already defined in one of its super class. If there is a method in a super class and method having the same name and same number of arguments in a child class then the child class method is said to be overriding the parent class method.

When the method is called with parent class object, method of the parent class is executed. When method is called with child class object, method of the child class is executed. So the appropriate overridden method is called based on the object type, which is an example of Polymorphism.

Program:

```
class Person:
 def___init__(self, name, age):
    self.name = name
    self.age = age
 def displayData(self):
    print('In parent class displayData method')
    print(self.name)
    print(self.age)
class Employee (Person) :
  def___init__(self, name, age, id):
    # calling constructor of super class
    super().__init__(name, age)
    self.empId = id
  def displayData(self):
    print('In child class displayData method')
    print(self.name)
    print(self.age)
    print(self.empId)
#Person class object
person = Person('Karthik Shaurya', 26)
person.displayData()
#Employee class object
emp = Employee(''Karthik Shaurya', 26, 'E317')
emp.displayData()
```

Output:

Signature of the Faculty

Exercise Programs:

- 4. Write a Python program to illustrate the following comprehensions:
 - a) List Comprehensions
- b) Dictionary Comprehensions
- c) Set Comprehensions
- d) Generator Comprehensions
- **Comprehensions in Python**

Comprehensions in Python provide us with a short and concise way to construct new sequences (such as lists, set, dictionary etc.) using sequences which have been already defined. Python supports the following 4 types of comprehensions:

- a) List Comprehensions
- b) Dictionary Comprehensions
- c) Set Comprehensions
- d) Generator Comprehensions

a) List Comprehensions:

List Comprehensions provide an elegant way to create new lists. The following is the basic structure of a list comprehension:

output_list = [output_exp for var in input_list if (var satisfies this condition)]

Note that list comprehension may or may not contain an if condition. List comprehensions can contain multiple **for** (nested list comprehensions).

Example: Suppose we want to create an output list which contains only the even numbers which are present in the input list. Let's see how to do this using *for loop* and *list comprehension* and decide which method suits better.

Using Loop:

```
#Constructing output list WITHOUT using List comprehensions input list = [1, 2, 3, 4, 4, 5, 6, 7, 7]
```

output list = []

#Using loop for constructing output list
for var in input_list:
 if var % 2 == 0:
 output list.append(var)

print("Output List using for loop:", output list)

Output:

2022-2023

Using List Comprehension:

Using List comprehensions # for constructing output list input_list = [1, 2, 3, 4, 4, 5, 6, 7, 7] list_using_comp = [var for var in input_list if var % 2 == 0] print("Output List using list comprehensions:",list_using_comp)

Output:

b) Dictionary Comprehensions:

Extending the idea of list comprehensions, we can also create a dictionary using dictionary comprehensions. The basic structure of a dictionary comprehension looks like below.

output_dict = {key:value for (key, value) in iterable if (key, value satisfy this condition)}

Example 1: Suppose we want to create an output dictionary which contains only the odd numbers that are present in the input list as keys and their cubes as values. Let's see how to do this using for loops and dictionary comprehension.

Using Loop: input_list = [1, 2, 3, 4, 5, 6, 7] output_dict = {} # Using loop for constructing output dictionary for var in input_list: if var % 2 != 0: output_dict[var] = var**3 print("Output Dictionary using for loop:",output dict)

Output:

Using Dictionary Comprehension:

Using Dictionary comprehensions # for constructing output dictionary input_list = [1,2,3,4,5,6,7] dict_using_comp = {var:var ** 3 for var in input_list if var % 2 != 0} print("Output Dictionary using dictionary comprehensions:", dict_using_comp)

Output:

Example 2: Given two lists containing the names of states and their corresponding capitals, construct a dictionary which maps the states with their respective capitals. Let's see how to do this using for loops and dictionary comprehension.

Using Loop:

```
state = ['Gujarat', 'Maharashtra', 'Rajasthan']
capital = ['Gandhinagar', 'Mumbai', 'Jaipur']
output_dict = {}
# Using loop for constructing output dictionary
for (key, value) in zip(state, capital): output_dict[key] = value
print("Output Dictionary using for loop:", output_dict)
Output:
```

Using Dictionary Comprehension:

```
# Using Dictionary comprehensions
# for constructing output dictionary
state = ['Gujarat', 'Maharashtra', 'Rajasthan']
capital = ['Gandhinagar', 'Mumbai', 'Jaipur']
dict_using_comp = {key:value for (key, value) in zip(state, capital)}
print("Output Dictionary using dictionary
comprehensions:",dict_using_comp)
```

Output:

c) Set Comprehensions:

Set comprehensions are pretty similar to list comprehensions. The only difference between them is that set comprehensions use curly brackets { }. Let's look at the following example to understand set comprehensions.

Example : Suppose we want to create an output set which contains only the even numbers that are present in the input list. Note that set will discard all the duplicate values. Let's see how we can do this using for loops and set comprehension.

```
Using Loop:
```

```
input_list = [1, 2, 3, 4, 4, 5, 6, 6, 6, 7, 7]
output_set = set()
# Using loop for constructing output set
for var in input_list:
    if var % 2 == 0:
        output_set.add(var)
```

print("Output Set using for loop:", output_set)

Output:

Using Set Comprehension:

```
# Using Set comprehensions
# for constructing output set
input_list = [1, 2, 3, 4, 4, 5, 6, 6, 6, 7, 7]
set_using_comp = {var for var in input_list if var % 2 == 0}
print("Output Set using set comprehensions:",set_using_comp)
```

Output:

d) Generator Comprehensions:

Generator Comprehensions are very similar to list comprehensions. One difference between them is that generator comprehensions use circular brackets whereas list comprehensions use square brackets. The major difference between them is that generators don't allocate memory for the whole list. Instead, they generate each value one by one which is why they are memory efficient. Let's look at the following example to understand generator comprehension:

```
input_list = [1, 2, 3, 4, 4, 5, 6, 7, 7]
output_gen = (var for var in input_list if var % 2 == 0)
print("Output values using generator comprehensions:", end = ' ')
for var in output_gen:
    print(var, end = ' ')
```

Output:

6. Write a program for Linear Search and Binary search

Linear Search Program:

```
def linearSearch(target, List):
    position = 0
    global iterations
    iterations = 0
    while position < len(List):
        iterations += 1
        if target == List[position]:
            return position
        position += 1
    return -1
if___name__== '___main__':
    List = [1, 2, 3, 4, 5, 6, 7, 8]
    target = 3
    answer = linearSearch(target, List)
    if answer != -1:
        print('Target found at index :', answer, 'in',
               iterations,'iterations')
    else:
        print('Target not found in the list')
```

Output:

2022-2023

Binary Search Program:

```
def binarySearch(target, List):
    left = 0
    right = len(List) - 1
    global iterations
    iterations = 0
    while left <= right:
        iterations += 1
        mid = (left + right) // 2
        if target == List[mid]:
            return mid
        elif target < List[mid]:</pre>
            right = mid - 1
        else:
            left = mid + 1
    return -1
if __name__== '__main__':
    List = [1, 2, 3, 4, 5, 6, 7, 8, 9, 11, 12, 13, 14]
    target = 12
    answer = binarySearch(target, List)
    if (answer != -1):
        print('Target',target,'found at position', answer, 'in',
               iterations,'iterations')
